# Sanay Krishna

Cloud Security · Security Operations · BCA Honours, Chanakya University, Bangalore
sanay.rein@gmail.com | linkedin.com/in/sanaykrishna | github.com/SanayKrishna | tryhackme.com/p/mochi1 | +91 7510554785

## EDUCATION

**Bachelor of Computer Application (BCA Honours)** **Expected Jun 2027**
*Chanakya University, Bangalore, Karnataka · CGPA: 9.28 / 10*

## TECHNICAL SKILLS

**Cloud & AWS** AWS S3 · CloudTrail · EventBridge · Lambda · SNS · IAM · Boto3 · Terraform
**Security** MITRE ATT&CK · SIEM · SOAR · Incident Response · Threat Detection · CIS Benchmark
**Languages & Frameworks** Python · JavaScript · TypeScript · Java · SQL · Bash · Flask · FastAPI · React · Next.js · Scikit-learn
**Tools & Platforms** Nmap · Wireshark · Metasploit · Burp Suite · Linux · Git · GitHub Actions · PostgreSQL · SQLite · MySQL

## TECHNICAL PROJECTS

**MITRE ATT&CK Cloud Detection Engine · github.com/SanayKrishna/Mitre-Cloudtrail-Detection** **Cloud Threat Detection**

- Reads AWS CloudTrail logs, from files or live through Boto3, and flags attacker activity such as logging being switched off, extra access keys added to accounts, or data moved to an outside AWS account. Every alert is labelled with its MITRE ATT&CK technique, taken from MITRE's official dataset.
- 39 rules covering 20 techniques. Each rule is a small data object that names the service, the API calls, and an optional extra check, so adding a detection never touches the engine. A coverage page shows which cloud techniques still have no rule.
- Wrote rules to match real CloudTrail logs, not the spec: console logins are logged under signin.amazonaws.com, so rules written to the spec would never have fired. Kept detections working when the 2026 ATT&CK release revoked the cloud-logging technique. 33 tests run against the real MITRE data.

**CloudScanner, S3 Security Monitor · github.com/SanayKrishna/CloudScanner** **AWS Security Monitoring**

- Scans every S3 bucket in an AWS account for public access, loose ACLs or policies, cross-account access and missing Block Public Access. Each finding is rated Low to Critical and mapped to CIS AWS Foundations Benchmark and AWS Security Hub controls.
- Real-time alerting through CloudTrail, EventBridge and Lambda: when someone changes a bucket policy, ACL or encryption setting, or deletes a bucket, an SNS alert shows who did it, from which IP, and on which bucket. Infrastructure is in Terraform; 24 offline tests run in GitHub Actions CI.

**AI-Powered SOAR Engine · github.com/SanayKrishna/Ai-Powered-Soar-Engine** **SOC Alert Triage**

- Alert-triage prototype. A Random Forest model trained on synthetic alerts scores each incoming alert from 1 to 100, and the score decides the playbook: open a ticket, notify the team on Slack, or isolate the endpoint (simulated).
- Posts high-risk alerts to Slack through an incoming webhook and logs every alert and action to SQLite for an audit trail. A Flask and Chart.js dashboard shows the live queue and risk trends.

## EXPERIENCE

**Application Security Intern** **Dec 2025 – Present**
*Genki to Asia Co., Ltd., Japan · Remote*

- Performed OWASP Top 10 and Mobile Top 10-based security reviews for the KoKoMata mobile app, co-designing mitigations with a fellow intern: enforced access control via Row-Level Security, schema-isolated secrets, and SECURITY DEFINER RPCs; secured session storage on-device via expo-secure-store.
- Reviewed OAuth-based authentication, parameterized query handling in privileged database functions, and HMAC-based location-privacy logic; contributed audit logging and rate-limiting controls to flag anomalous unlock attempts.

## ACHIEVEMENTS

**2nd Place — IKS Hackathon 2026 · Chanakya University** **ChandaEngine · 8 Days · Team of 4**

- Built a computational implementation of Chandas Shastra: rule-based syllabifier with consonant-cluster lookahead, 15+ classical meter validators, FastAPI backend, Next.js frontend, Sarvam AI TTS/STT integration, and 21 passing unit tests.

**3rd Place — Srujana Hackathon 2025 · Chanakya University** **Netā-Nomics · Governance & AI**

- Built an AI pipeline using Tesseract OCR and Google Gemini API to structure government expenditure data from unstructured PDFs, with multi-agent anomaly detection and automated RTI/PIL document generation (Next.js · FastAPI · PostgreSQL).

## CERTIFICATIONS

**Introduction to Cybersecurity** **Cisco · 2023**
**Google IT Automation with Python Specialisation** **Coursera / Google · 2023**
